Citation: Desmond Ayim-Aboagye. A Psychophysical Theory of Waves Concerning the Element “Spiritual Beings”. Neurol Res Surg. 2026; 9(4): 1-7.

ABSTRACT

The theory that spiritual bodies originate from the stars in the multiverse is proposed. These are inorganic bodies that can see and fly around in the solar system, and they behave as waves. These beings possess the characteristics of waves and exist within the electromagnetic fields permeating the multiverse. The spiritual beings also possess electricity and magnetism. It is more probable that what our forefathers encountered in our solar system, and we think of every day as Gods, are created beings who exist in the solar systems of the multiverse.

Keywords

Electromagnetic wave, Electromagnetic fields, Quantum hypothesis, Electricity and magnetism, Spiritual bodies, Spirits, the Stars, Electromagnetic properties.

Introduction

Why has interest grown in the science of the genesis of the Spiritual bodies? Are they meant to be worshipped? Was it due to a misunderstanding of their origin in the multiverse that people adore them? Is the power they have over humans due to their ability to electrocute and kill, rather than to their possession of some mysterious powers? The paper explores the scientific study of the theory that the Stars gave rise to spiritual entities, which exist in the form of “waves”, and how, due to ignorance, humans have become interested in their presence and have constantly worshiped them. This worship has also led to the self-made promise that they will attain eternal life, wellness, and happiness if they worship them.

The Stars (Sun), the Origin of Spiritual Bodies and EM Multiverse

The Sun, the greatest star in the solar system, is about 93 million miles away from the Earth. Roughly, this is about 150 million kilometers away from the habitable planet Earth and its human inhabitants. It would have been hazardous to humans if it were

closer to Earth. Likewise, the Star nature of the element called “Spirit” compels them to live always separate and absolutely hidden from human beings, like waves. This is not for the spirit's sake, but for the health's sake of a human person sometimes used as a host, or their numerous attendants who are attracted to them as worshippers, that they must keep away. Like the Sun, the spirits must shield themselves from delicate and fragile human beings to prevent incessant destruction. Some use human beings as hosts and loiter in their stomach and intestines in the form of a wave, while the majority of human beings on Earth worship them as Gods, and through this process become their dependent subjects.

The Spirits (the gods and witches), for example, are innately enshrouded in electromagnetic properties (EM/EP) because they are formed in materials from the Stars, which also possess electricity and magnetism. Their dangerous and destructive nature compels them to use their powers to coerce individuals to sleep more deeply before they leave for night duties. In the case of individuals who are awake and sleeping beside the witch's body, they magnetize them [like an electric shock] to prevent them from experiencing catastrophe and instant electrocution, or else they will subsequently die as a result of being burnt to ashes. The purpose of magnetization, which we shall discuss below, restricts any human movement around them, whether sleeping or awake, to protect and safeguard their exit from the vicinity of human beings

to space where they are environmentally safe. So far as scientific evidence has shown, one could describe the material composition of spiritual beings to be made up of “energy”, “light”, “force”, and “electromagnetic properties”, and they exist in the form of “waves” created by the Stars.

Electromagnetic Properties

What are properties of electromagnetic waves that physicists and Astrophysicists talk about? In scientific literature and journals, Electromagnetic waves and properties, commonly abbreviated (EM), are electrical conductivity, dielectric permittivity, and magnetic permeability. These physical properties manifest themselves in diverse ways within nature. EM properties are functions of the operating frequency of the externally applied Electromagnetic Field (EMF). What are EM fields? Physicists talk about EM fields as a combination of invisible electric and magnetic fields. These properties are generated by natural phenomena such as the Earth’s magnetic field and through human beings’ use of electricity [1].

Stellar Magnetic Field

According to astrophysicists, Stars do have electromagnetic fields. We witness these activities in the solar flares that occur regularly on Earth. In fact, they are common. These fields are thought to be formed by the so-called α - Ω dynamo process in convective inner stellar regions. So the stars do produce plasma that harbors electromagnetic fields, and these create enormous electric currents around their orbits. The activities are described like this that: the atoms in the atmosphere of the star will absorb certain frequencies of energy in the electromagnetic spectrum, producing characteristic dark absorption lines in the spectrum [2]. So, when the atoms are within a magnetic field, one observes that these lines become split into multiple, closely spaced lines [3]. Thus, again, a stellar magnetic field is generated by the motion of conductive plasma inside a star. The motion is driven by convection. This is a form of energy transport involving the physical movement of material. It is thought that a localized magnetic field exerts pressure on the plasma, effectively enhancing the pressure without a comparable gain in density [4]. As a result, the magnetized portion emerges relative to the residue of the plasma, until it lands on the photosphere of the Star [5]. This eventually causes spots on the surface of the Star and the related phenomenon that we see in the coronal loops.

Magnetics Stars

There are Magnetic stars in space, and one such star is the AT Tauri star. It is a type of pre-main-sequence star that is continually heated through gravitational contraction and has not yet commenced burning hydrogen at its central sphere. One can call these stars variable stars that are magnetically active. The magnetic field of these prospective stars is asserted to interact with their enormous stellar wind that carries angular momentum to the surrounding proto-planetary disk. This compels the star to gradually halt its rotation rate as it collapses [3].

There are also small, M-class stars (which have solar masses 0.1–

0.6) that are characterized by rapid, irregular variability typically known as flare stars. These fluctuations in their salient activities are predicted to be the reason that they cause enormous flares. Their activities are much stronger relative to their sizes. The flares that occur on this class of stars extended up to twenty percent of their circumference. Also, they radiate much of their energy in the blue and ultraviolet portion of the spectrum [4].

Neutron Stars consist of Pulsars and Magnetars

When a massive star explodes (i.e., Supernova) after its lifespan, the remaining core forms a star known as a neutron star. The neutron star usually appears to be of different types, consisting fast-spinning Pulsars and strongly magnetic star called Magnetars. Later there have been other discoveries of smaller types by astronomers.

The Milky Way galaxy which our own Earth inhabits, consists of different stars of which millions have been classified to neutron stars. They are made mainly of neutrons, that is, subatomic particles with no electric charge. One can think of these stars as stellar corpses which populate themselves more than the Sun's mass within a sphere of one Swedish mile in diameter (6 British) miles. In fact, neutron stars are so dense that astronomers conjecture that a sugar-cube-size of a neutron star would weigh greater than all citizens of the planet Earth.

Astrophysicists and astronomers inform us that among the neutron stars, there are some that show extreme appearances than others. Thus, two types of these neutron stars have been categorized based on how fast they spin and how strong their magnetic field consist of. Known as Pulsars, these stars spin faster up to hundreds of revolutions per second. Their poles exhibit beams of electromagnetic radiation, radio waves, visible light, X-rays and gamma-rays. Their rotations allows astronomers to detect their radiation regularly timed pulses, exactly the same as a spinning lighthouse that often flashes on and off along big cities in modern coastlines.

The other variant of neutron star is the Magnetars, which are named because of their ultra-strong magnetic field. They possess the magnetic field of about 100 thousand million Tesla. This is a thousand times more than a normal neutron star. To describe it danger to the Earth and its development, it is asserted that most media data storage can be removed if they are exposed to a magnetic field of one thousandth of a Tesla. Thus, these types of star can be detrimental to our current civilization unless it is protected from them [5].

Theory of Light, Electricity, and Magnetism

To delve briefly into the characteristics of light, electricity, and magnetism, which are discussed in physics literature and sundry journals that fill libraries and the internet, the work of the 19th-century scientist James Clerk Maxwell and several others showed that electromagnetism is a fundamental force of nature. Several scholars contributed to the development of these theories around electromagnetism. The theory postulates that electric charges

and magnetic fields interact. Furthermore, it states that a moving electric charge creates a magnetic field, and a changing magnetic field releases an electric current [6]. Maxwell's work succeeded in developing electromagnetism into four mathematical equations. They comprise four major laws, and each describes a specific aspect of electricity and magnetism. In Physics, this has been proved to be one of the four core forces on which modern technologies such as motors and radio waves depend. Maxwell's equations consist of Gauss's law for electricity, Gauss's law for magnetism, Faraday's law of electromagnetic induction, and Ampere-Maxwell's law. They form the foundation of classical electromagnetism. Gauss's Law for Electricity explains that electric charges produce electric fields. Field lines start on positive charges and end on negative charges. Gauss's Law for Magnetism indicates that magnetic monopoles do not exist. Magnetic field lines always form continuous closed loops, meaning north and south poles are always paired. Faraday's Law of Induction states that a changing magnetic field creates a circulating electric field. This is how electrical generators work. Finally, Ampère-Maxwell Law argues that Magnetic fields are generated by moving electric charges (currents) or by changing electric fields [7].

Electromagnetic Waves (EMW)

The EM waves are commonly found in the electromagnetic field. This electromagnetic field permeates space, so electromagnetic waves, such as light waves, can travel just about anywhere. The most common property of light is its maximum speed, known in physics as the speed of light (c). Electromagnetic waves are distinguished from each other by their wavelength (λ), and their frequency is shown to be represented by the following formula: ($F = c/\lambda$). In what follows, I shall put the witch and god's spirit into a formula to show that they also travel at the speed of light. They possess electromagnetic powers and also manifest as waves in that they can travel just about any time to everywhere by using the wave medium [8].

Empirical Material and a Hypothesis

A Witch Spirit Confirms Spirits Exist in the Form of a Wave

Empirical evidence reveals that the witch power is not something one would desire if people were aware of it and what it comprises. The witches and demon spirits emerge from the host individual's mouth as a wave. They loiter in human beings' stomachs and internal organs as waves during the day, and in the night they eject themselves into electromagnetic waves in space, where they feel safe. As soon as the wave emerges, using the method of witch-spirit acceleration effect (WSAE), it turns into a **black animal-like creature**. The size may be that of a rat or its equivalent. It does not walk but flies, yet has no wings. It has a **strong odor** coming from the host individual's stomach, and is felt strongly when it is closer to the body. It leaves the body and returns after 3 to 4 hours each night (from 02.00 A.M to 05.00 A.M). In space and Earth orbit, the Spirit burns like a star in the night by emitting electromagnetic waves shining like a star, and flies around in different circles, and it can fly vertically very high, like modern rockets. The Spirit can burn a human being who challenges it, so the Spirit has an element of fire, as exemplified in the cases of meeting Abraham

and Moses by God. Witch-Spirit, like STARS, glitters through their emission of electromagnetic waves in open space. Witch spirit can see, so it could dim as well as magnify to conceal its presence in the night. The Spirits' greatest powers are their abilities to **electrocute and kill instantly**, which was displayed with the killing of the individual who thought he was protecting the **ARK OF COVENANT** described in the Judeo-Christian religion. The Ark nearly fell, and he attempted to save it. A witch could display this same power when a person who sleeps beside him is awake and refuses to sleep to make way for his regular exit in the deep night. When a Spirit returns to its sleeping body, it metamorphoses into a **wave** and enters the body again. This could easily allow a person sleeping beside the witch's body to wake him up and touch him, and he will open his eyes [9].

Psychophysical Stages of Sleep: REM Sleep vs. NREM Sleep

This is the scientific explanation of the *Spirit coarsening deep sleep*. At 2.00 AM, any human being in bed would be experiencing deep sleep, known as REM sleep in Medical psychology. We can analyze it scientifically. The Spirit then ejects at this time period [about 2.00 AM] in deep sleep, allowing it to exit without causing injuries or harm to those who sleep beside him. REM sleep is a crucial sleep stage characterized by rapid eye movements, vivid dreaming, increased brain activity, and temporary muscle paralysis known as Atonia. Deep sleep is vital for learning, memory consolidation, and emotional processing, and occurs in cycles throughout the night. The Spirit will, however, not depart in a period when human beings are experiencing NREM sleep [i.e., before 2.00 AM]. The NREM sleep, which can be considered preliminary sleep, occurs in three stages: from the waking state, followed by N1, N2, and N3. Stages N1 to N3 are non-rapid eye movement sleep, with each stage leading to progressively deeper sleep. Scientists assert that around 75% of most sleeping periods of humans are spent in the NREM stages, with the majority occurring in the N2 stage [10].

The Witch-Spirit Acceleration Effect (WSAE)

We have stated earlier that the Witch-Spirit exists as a "wave" and loiters in the host human individual's stomach and intestines during the day. At night, it emits electromagnetic waves that permeate the whole of space, appearing as a shining star. It moves around in circles, but could also skyrocket like a modern Rocket. This takes place when any person sleeping beside the Witch is fast asleep, coinciding with REM sleep in medical psychology. Any person sleeping beside this person who is still awake will be magnetized before the spirit can exit without harming him. Magnetization ensures that the spirit, who by nature is a star, does not cause permanent injury or irreparable damage to the person sleeping beside the witch. While a few humans are still awake or enjoying NREM sleep (before 2.00 a.m. in the night), the majority of human beings are enjoying REM sleep (2.00 a.m. and onwards).

The Witch-Spirit Acceleration Effect, which could be referred to as "Mechanical effect", occurs when the spirit emerges as a wave from the stomach and intestines of the host human individual through its mouth and swiftly rolls over 3 to 4 times to turn into a creature-like

substance which escapes outside to emit electromagnetic waves, making him look like a star. This mechanical effect occurs swiftly and energizes the spirit to possess a form that enables it to perform work of movement and shine in the form of an existing star.

The 3 or 4 hours display of the Witch-Spirit in the electromagnetic wave in space/Earth orbit elapse, and he returns to his sleeping body. The spirit returns into the body in two forms/ways: (1) The spirit returns flying with full speed, which coincides with REM sleep, where he can also magnetize the individual who is awake and sleeping beside the body, and (2) The Spirit could sneak quietly without being seen by any person sleeping beside the body and jump into the open mouth of the witch's body, which will be waiting to swallow it. While his ejection out has to occur through only the host individual's mouth, returning into the stomach can occur through penetration outside the body. This procedure is shown by the body behaving as if he is breathing out. Or like a pregnant woman delivering a baby, which will shake the whole body at once. That means the spirit has entered the body successfully. The last-mentioned return, which is the second one, occurs when the witch-spirit discovers that he is late, as daybreak is almost near. The witch-spirit, as a star, confirms that spirits in general exist as waves in the multiverse. Below are Figures 1, 2 and 3, which represent the formulas for the Witch and God Spirits:

Formula for the Spirit in Manifestation as a Wave

T_B = Time with Beta Dynamo ("small scale")

λ = Wave

C = Speed of light

E_s = Energy of the Spirit

W = Witch

G = God/god

EM = Electromagnetic Waves

Λ = Dark Energy

$$W = T_B(E_s \lambda / c)$$

Figure 1: Formula for the Witch Spirit.

$$G = \Lambda E_s \lambda / c$$

Figure 2: Formula for the God Spirit.

$$S = (\Lambda) EM \lambda / C$$

Figure 3: Formula for Spirit (S).

Magnetization: A force employed to Protect Individuals by Spirits

Magnetic Force and the Three Uses by Spirits

By our meticulous observation, a typical Spirit uses magnetic force/power and electrical force in the form of electrocution to 1) **hurt others**, 2) **protect itself**, and 3) **enshroud** its presence within the vicinity of human beings. This use of magnetic and electrical forces has given us a clue about these spirits' origin in nature, and this understanding has enabled us to trace their evolutionary path to reality. We must explain in detail what we mean by "magnetization" of the spirit to comprehend the unique characteristics of spirits such as the Witch and God. Had the historical Moses studied Physics and Astrophysics, he could have been the first human being that ever lived to comprehend well what a spirit entails in terms of its unique characteristics or properties. Instead, he honestly described his unique experience, noting that God "put him in a cleft" as He manifested Himself to him on the mountain, in response to his insistence that he wanted "to see him face to face".

What do we mean by "to be magnetized by a Spirit?" What does this phenomenon entail? Which kinds of Spirits use this powerful mechanism, and what does magnetization accomplish for these Superior Beings or Spirits? As the spirit already described in the previous article by Ayim-Aboagye embodies light, force, energy, and electromagnetic properties such as magnetism and electricity, its presence in the vicinity of a human being becomes a matter of extreme danger that could ignite sudden destruction and resultant death. The magnetic force is leached to surround the human organism to give him absolute protection that guarantees his survivability after this ordeal. It is like being tied down by all the ropes on earth, but that would not be enough because a person who had been tied down could still move or shake his body and shout as well. It is like being poured over with all the glue on earth, but still that would not be enough because a person could shout and try to untangle himself. A witch or God's magnetization entails an extraordinary superior situation where a person could be asserted to be dead and yet have his body preserved. Supposing this person was not asleep but awake with his eyes open, he or she could not move the eyeballs, though he could see what is before him or going on the sides. Magnetization is like a person having received an electric shock or electrocution, which stops the heart immediately, but the only difference is that the body does not become black or carbon as we see with real electrocution by electricity. I think what magnetization does in principle is that it stops the organism's

heartbeat, supposing he dies eventually through this process.

Magnetic Force Use in Lesser Spirits (MLS)

One would ask why the Spirits use this extreme mechanism in confronting a mere human being he wants to meet. First, it is due to his nature as a star and the surrounding properties that are dangerous to humans who possess flesh and blood. Another important thing concerns human desire to be with Him (God) and probably affirm his death as worthy, and like all human beings pointing hands and embracing the Holy one (God) as something that could bring some form of satisfaction. There is insanity and confusion involved as the person faces an abnormal situation. It is worth pointing out that apart from the Witch and God, other minor spirits employ the mechanism of magnetization to accomplish their evil intentions or work. Lesser spirits use magnetic power to trap their victims before doing them harm or killing them. In one special Institution of learning in West Africa where people have experienced deaths due to spiritual means, the spirit in question uses a huge stone from heaven that pounces on his victims. The victims are not able to move their feet and run when the huge stone is falling from above to hit and kill them. According to several accounts, the experience is like one standing on a train's path and being caught by magnetic force. A person will be fastened to the train lines or the ground until the huge stone crushes a person. This spiritual magnetization experience in a dream or day vision will lead to the death of the victim. Thus, other spirits use the magnetic force to corner their victims to enable them to kill them.

Failure in Magnetization

We see the old account among the Israelites concerning the individual who failed to observe the instruction given by the spirit not to touch the Ark of the Covenant. His disregard led to his instant electrocution. The person who is not magnetized by the spirit will eventually die or experience irreparable damage or injury. The advantage of magnetization is that it symbolizes the care of these spirits, for example, the Witch or God, to protect the human organism once they have agreed to make themselves available for communion or display of their powers. In the Witch-Spirit Acceleration Effect (WSAE), anybody who sleeps beside the witch's body is magnetized, whether asleep or awake, to prevent injury or death.

Strong Electrical Current Composition of the Main Body

Meticulous observation reveals that the witch uses this power to cause a person to sleep deeply, which coincides with REM sleep, or force a person awake to be magnetized, before his ejection from the stomach of the host individual in the form of a wave. In Moses' experience, God asserted in his own words: "You cannot see my face and live". Instead, I shall allow you to see the back of my head. Without the magnetization, the high electrical input or power could kill instantly. High electrical current with high voltage kills individuals who play with it.

Post Magnetization Disorders?

Individuals begin to wonder about this unique near-death experience after the exit of the spirit, be it a witch or God, but they

are not capable of explaining it adequately. Without knowledge of Physics and Astrophysics, the usual interpretation is bizarre and can be given religious connotation. This has kept many able academics from seeing and investigating the origin of these spirits. There is some insanity involved in seeing and experiencing it and talking about it to others. A person could easily be branded a witch himself or mentally unstable due to his confusion. In the future, when the theory has been adequately investigated and accepted by able Physicists, astrophysicists, or scientists, people considered to be witches will be understood well, and there will be an attempt by medical doctors, specifically psychiatrists, to intervene and help people who recognize themselves as witches. The manner in which these spirits eject themselves from the mouths of the host individuals during REM sleep of others, and their return to their internal organs where they loiter during daytime, constantly appears to me to be a disorder that patients have to experience throughout their lives. That is all the more reason people who possess these spirits appear weary and troubled in secret. They suffer the rest of their lives in secret since they have no control over the workings of the spirits they harbor.

Mode of Appearance

We now come to the mode in which the spirits appear, especially the witch and the gods/God. The witch spirit appears in a quiet manner from the host individual's mouth except whenever there is an attempt to challenge him by victims. Then, he could be violent and burn the body of the doer and further go to the extent of electrocuting the victim. This usually leads to the victim's death. So far as the witch is concerned, his power is of such a magnitude that no human being can threaten his power to magnetize and exit into the electromagnetic wave in space or Earth orbit, to be specific. God/god can use violent means, such as the appearance of strong winds in a storm, thunder and lightning, a loud noise like a jet engine, an earthquake, or fire burning, to display the ultimate display of His majestic power. The stillness approach is common with the gods/God and could enter a room or a house without opening the door. God can use a human being or an angel as a medium or talk through animals, a stone, or a mountain to people. One common characteristic of God is His movement in the multiverse, which appears to conform to the speed of light (c), usually talked about by Physicists and Astrophysicists because the whole of space is permeated with electromagnetic waves (EMW), which he uses. While radio waves can pass through materials like bricks and walls, visible light cannot, but God's spirit penetrates all materials. Finally, one can assert that God has been proved to be Overlord and Master over Human beings, who also employ nature in general to accomplish his wishes.

Quantum and electricity-magnetism theories can explain.

Unfortunately, the type of elements that have been used to build the spiritual bodies is not visible to the human eye; like air, we visualize their effects, but we do not see their "skeletal" nature because they pose like a wave. We need special eyesight to see them and make their presence visible. At the moment, we lack those eyes. Our naked eyes are made to see the entity "light," which quantum theory could explain. The observable part that

human beings' eyes can see is light, such as the star of the witch, which flies in circles and in a vertical manner like modern rockets during the night in the electromagnetic waves that permeate space. Therefore, both quantum and electricity-magnetism theories can help us to understand how the spiritual elements were formed.

“Spirits” Hidden Abode in Space as “WAVES”

Why do they have to keep themselves hidden during the greater part of their eternal life? *By their nature, they are destructive/ dangerous to humans and many other animals with organic flesh and blood.* Due to the electromagnetic properties enshrined in their nature, human beings can be extinguished within a few seconds in any physical encounter with them. This is where their superiority stems from, but have been mistakenly interpreted and attributed to the all-powerful heritage. Where do they hide in the multiverse? Some use human beings as hosts, for example, witches and demons. *They loiter in human beings' stomachs and internal organs as waves during the day, and at night they eject themselves out into electromagnetic waves in space/Earth orbit, where they feel safe.* Others use nature and other spaces in different solar systems as their abode. Significantly, some philosophical writings point to many spirits living their lives as celestial beings in deep space galaxies, for example, stars, dwarf stars, and mini stars with unfamiliar bodies, such as dark matter. Again on Earth, some philosophers speculate that Maame Wattas loiter in the seas and their deep oceans; dwarves loiter in the mountains, caves, and forests. Other beings operate as river gods. But not all are as dangerous as the God/gods, though they possess electromagnetic properties that give them powers similar in nature to the gods.

Science and the Electromagnetic Properties of the Spirits Light, Force, and Energy

We have learned through several accounts and a recent investigation that the elements' spirits hurt others, protect themselves, and enshroud their presence with electromagnetic properties. They use the following innate capabilities, such as Fire, Star, Magnetic, Electricity, and Waves, to perform these deeds. These contain electromagnetic properties. These elements are currently being studied to disseminate knowledge that has led to scientific revolutions. Their results are magnificent, especially with the discovery of lasers and other inventions in the scientific world. Max Planck [11], the German physicist, was the first to state the quantum hypothesis, which was also enhanced by Albert Einstein, the philosopher-physicist, to propound the photoelectric effect [12]. Through a series of research projects in the physical sciences [13], the invention of the laser has led to significant breakthroughs in science. The preliminary work and invention of electricity and magnetism by James Clerk Maxwell and his English associates, such as Michael Faraday and the Cambridge scientist Sir Isaac Newton [14-16], was indispensable to the scientific breakthrough in the study of light, force, and energy.

Concluding Remarks

The scientific postulate regarding spiritual bodies as originating from the stars or dead stars known as neutron stars should be investigated further by scientists to help us comprehend why and

how spirits appeared in the multiverse. Scientifically, they exist in the world as waves and loiter in the strictly secluded virgin space of the multiverse. Witch and demon spirits, for example, loiter in human stomachs and internal organs in the form of waves during daytime, and at night they eject themselves out into electromagnetic waves in space, where they feel comfortable. The electromagnetic properties and scientific characteristics of the witch power compel us to postulate that the element originated from the stars or dead stars in the multiverse. This is the only source the witch power could come from, which also possesses electricity and magnetism. We think the spiritual bodies were created or formed by the Stars, and they exist as waves that permeate the whole multiverse. They have been generated by the process of the Star's formation and its microwave background, or during the Star's disintegration after its lifespan.

Recapitulation: Stars, Electromagnetism and the Emergence of Spiritual Bodies

A. Three Convincing Characteristics

- Sunspots appear as dark patches on the Sun's photosphere. They correspond to concentrations of magnetic field where convective heat transport from the solar interior to the surface is blocked. This makes sunspots slightly cooler than the surrounding photosphere, so they stay dark. Sunspots tend to form closer to the solar equator, an activity commonly referred to by astrophysics as Spörrer's law.
- Therefore, we can deduce that these stars; magnetic fields inhibit heat, especially around their equators, which are the coolest regions of the star.
- The Solar dynamo is the physical process that generates a star's magnetic field. The dynamo is, therefore, the mechanism by which a celestial body generates a magnetic field. These characteristics are common in supernova remnants, such as Magnetic Stars, and neutron stars such as Magnetars and Pulsars.

B. Three Convincing Characteristics of the Spirits

- The Spirits, imitating the Stars, tend to use their strong magnetic field/power to cool the human beings, or try to inhibit heat to protect the human individual closer to them. They use their magnetic powers as a cooling tool to protect human beings.
- Human beings face the cooling mechanism to help them survive the highly magnetic field due to the Spirits' presence.
- The “small-scale dynamo” is applied by the spirits; especially, the witch uses this physical process that generates a witch's magnetic field before it enters the electromagnetic waves in Earth orbit/Space. The dynamo mechanism is therefore the process by which a witch generates a magnetic field before moving out. It is explained in the Witch-Spirit Acceleration Effect (WSAE).

Epilogue: Electromagnetism and the Science of Spirits

As a young lad, when spirits entered into my room in the night at

Begoro-Akim, they quickly put out the kerosene lantern. Thus, any locally manufactured light, such as a candle, mariner's lamp, etc., could be put out easily by spirits. But as for the light that electricity produces, which has its source in electromagnetism (hydroelectric power), spirits can never put it out, however hard they try. That observation I made at a young age helped me to possess the knowledge that the presence of electricity can have affinity with the origin of spirits. Or, in general, that spirits are afraid of electricity because it possesses magnetic power. In fact, they are of the same kind. They use the Electromagnetic Waves (EMW). Later, my private investigations in Physics and Astrophysics, which I did mostly in textbook readings, on the internet, and the sundry observation of images made on European Space Agency (ESA) and National Aeronautics and Space Administration (NASA) Homepages during my PhD studies in Psychology of Religion and also PhD Medicine (Pain Studies) at Uppsala University, helped me understand the principles of electromagnetism well. It would enable me to combine all my experiences in the above-mentioned fields to propound this theory of psychophysical wave theory of spirits. In summary, the theories around electromagnetism I had borrowed from the rigorous sciences have contributed immensely to my development of the science of spirits.

Acknowledgment

The author would like to thank Dr. Evelyn Owusu Roberts, a Clinical Psychologist, and Dr. Martin Akakpo from the University of Health and Allied Sciences, Ho, for their helpful comments and criticisms.
